

Homework 2

1. Compute the following values:

φ : Euler totient function

(a) $\varphi(2)$, $\varphi(3)$, $\varphi(5)$

(b) $\varphi(2^2)$, $\varphi(3^2)$, $\varphi(5^2)$

(c) $\varphi(2^3)$, $\varphi(3^3)$, $\varphi(5^3)$

(d) $\varphi(6)$, $\varphi(10)$, $\varphi(15)$

Can you derive a formula for $\varphi(n)$?

$$(9) \quad \varphi(2) = 1, \quad \varphi(3) = 2, \quad \varphi(5) = 4$$

$$\varphi(p) = p - 1 \quad \text{when } p \text{ is prime.}$$

$$(b) \quad \varphi(2^2) = 2, \quad \varphi(3^2) = 6, \quad \varphi(5^2) = 20$$

$$\varphi(p^2) = p(p-1) = p^2 - p,$$

Proof:

List down all integers between 1 to p^2

1, 2, 3, ..., p

$p+1, p+2, p+3, \dots, 2p$

$2p+1, 2p+2, 2p+3, \dots, 3p$

\vdots

\vdots

$(p-1)p+1, (p-1)p+2, \dots, p^2$

All elements in each row is coprime to p except the last element, which is dp for some integer d .

There are p such elements: $p, 2p, \dots, p^2$

So, by removing these p elements, we get $p^2 - p$ integers, all of which are coprime to p .

$$(c) \quad \ell(2^3) = 4, \quad \ell(3^3) = 18, \quad \ell(5^3) = 100$$

Observation

$$\ell(p^2) = p^2 - p$$

$$\ell(p^k) = p^k - p^{k-1}$$

Proof:

Similar argument as before.

$$(d) \quad \varphi(6) = 2$$

$$\varphi(10) = 4$$

$$\varphi(15) = 8$$

By observation

$$\varphi(pq) = \varphi(p) \varphi(q) \quad \text{when } p \text{ and } q \\ \text{are coprime}$$

Proof: Use Chinese Remainder Theorem.

$$\mathbb{Z}_{pq}^* \cong \mathbb{Z}_p^* \times \mathbb{Z}_q^*$$

$$\text{since } \gcd(p, q) = 1$$

This implies that $\varphi(pq) = \varphi(p) \cdot \varphi(q)$

Unique prime factorization

$$n = p_1^{a_1} p_2^{a_2} \dots p_n^{a_n}$$

p_i are prime

Examples

$$6 = 2 \cdot 3$$

$$8 = 2^3$$

$$100 = 2^2 \cdot 5^2$$

$$\ell(n) = \ell(p_1^{a_1} p_2^{a_2} \dots p_n^{a_n})$$

$$= \ell(p_1^{a_1}) \ell(p_2^{a_2}) \dots \ell(p_n^{a_n})$$

$$= (p_1^{a_1} - p_1^{a_1-1}) (p_2^{a_2} - p_2^{a_2-1}) \dots$$

$$(p_n^{a_n} - p_n^{a_n-1})$$

2. Let $p = 5$.

$$\mathbb{Z}_p^* = \{1, 2, \dots, p-1\}$$

is a group under multiplication mod p

a)

g	order of g in \mathbb{Z}_p^*
1	
2	
3	
4	

b) Is \mathbb{Z}_p^* a cyclic group?
(Can you find a generator?)

c)

g	$g^{p-1} \pmod{p}$
1	
2	
3	
4	

3. Let $n = 12$

$$\mathbb{Z}_n^* = \{1, 5, 7, 11\}$$

is a group under multiplication mod n

a)

g	order of g in \mathbb{Z}_n^*
1	
5	
7	
11	

b) Is \mathbb{Z}_n^* a cyclic group?
(Can you find a generator?)

c)

g	$g^4 \pmod n$
1	
2	
3	
4	

4. Let x_1, x_2 be integers.

Let m_1, m_2 be coprime integers.

Suppose there exist n_1, n_2 such that

$$m_1 n_1 + m_2 n_2 = 1.$$

Show that $x = x_1 m_2 n_2 + x_2 m_1 n_1$
satisfies

$$x \equiv x_1 \pmod{m_1}$$

$$x \equiv x_2 \pmod{m_2}$$

Implication:

If we can find n_1, n_2 such that

$$m_1 n_1 + m_2 n_2 = 1,$$

then we can solve x explicitly by

setting
$$x = x_1 m_2 n_2 + x_2 m_1 n_1,$$

This gives the construction proof for the existence of x in Chinese Remainder Theorem.

By assumption, $m_1 n_1 + m_2 n_2 = 1$ (eq 1)

$$\begin{aligned} X &= X_1 m_2 n_2 + X_2 m_1 n_1 \\ &= X_1 (1 - m_1 n_1) + X_2 m_1 n_1 \\ &= X_1 - X_1 m_1 n_1 + X_2 m_1 n_1 \\ &\equiv X_1 \pmod{m_1} \end{aligned}$$

$$\begin{aligned} X &= X_1 m_2 n_2 + \cancel{X_2 m_1 n_1} \\ &= X_1 m_2 n_2 + X_2 (1 - m_2 n_2) \\ &= X_1 m_2 n_2 + X_2 - X_2 m_2 n_2 \\ &\equiv X_2 \pmod{m_2} \end{aligned}$$

Alternate proof:

$$(eq 1) \pmod{m_1} \rightarrow m_2 n_2 = 1 \pmod{m_1}$$

$$\begin{aligned} X \pmod{m_1} &= X_1 m_2 n_2 \pmod{m_1} \\ &= X_1 \pmod{m_1} \end{aligned}$$

$$(eq 1) \pmod{m_2} \rightarrow m_1 n_1 = 1 \pmod{m_2}$$

$$\begin{aligned} X \pmod{m_2} &= X_2 m_1 n_1 \pmod{m_2} \\ &= X_2 \pmod{m_2} \end{aligned}$$
